2025 - 2026

DECLARATION

I, **CHANDU A M** bearing the 4JD22IS012, student of 8th Semester B.E. Department of Information Science and Engineering, **Jain Institute of Technology, Davanagere**, declare that the AICTE Activity work entitled “**AICTE ACTIVITY WORK**”, has been duly executed by me under the guidance of **Dr. Latha B M**, Department of Information Science and Engineering, Jain Institute of Technology, Davanagere. The Activity report of the same is submitted in partial fulfilment of the requirement for the award of Bachelor of Engineering degree in Department of Information Science and Engineering by Visvesvaraya Technological University, Belagavi during the year 2025- 2026.

Date:
Place: Davanagere

CHANDU A M
4JD22IS012

ACKNOWLEDGEMENT

Although a single sentence hardly suffices, I would like to thank almighty God for blessing me with his grace and taking my endeavor to a successful culmination.

I express my gratitude to my guide **Dr. Latha B M, Professor & Head, Dept. of IS&E, JIT, Davanagere**, for **her** valuable guidance and continual encouragement and assistance throughout the Activity Work. I greatly appreciate the freedom and collegial respect. I am grateful to **her** for discussions about the technical matters and suggestions concerned to my topic.

I extend my sense of gratitude to **Dr. Meghana G R, Associate Professor, Activity coordinator, Department of IS&E, JIT, Davangere**, and **Ms. Thanu M R, Assistant Professor, Department of IS&E** for extending support and cooperation which helped me in completion of the activity work.

I extend my sense of gratitude to **Dr. H S Saraswathi., Associate Professor, Department of IS&E, JIT, Davangere**, for extending support and cooperation which helped me in completion of the activity work.

I would like to express my sincere thanks to **Dr. Ganesh D B, Principal, J.I.T, Davangere** for extending support and cooperation which helped me in the completion of the activity work.

I would like to extend my gratitude to all staff of **Department of Information Science and Engineering** for the help and support rendered to me. I have benefited a lot from the feedback, suggestions given by them.

I would like to extend my gratitude to all my family members and friends especially for their advice and moral support.

ACTIVITY - 01
CREATING AN AWARENESS REGARDING RAIN
WATER HARVESTING IN URBAN AND
RURAL AREA

ABSTRACT

This project focuses on creating awareness about the importance of rainwater harvesting among people living in both urban and rural areas. With the rapid depletion of groundwater levels and increasing water scarcity, it is essential to educate communities about sustainable water management practices. The initiative aims to highlight the benefits of collecting and storing rainwater for domestic, agricultural, and industrial purposes. Awareness programs, workshops, and demonstrations are conducted to show simple and cost-effective rainwater harvesting techniques suitable for different regions. In urban areas, the emphasis is on rooftop harvesting and groundwater recharge systems, while in rural areas, traditional pond and pit methods are promoted. The project encourages community participation, school involvement, and collaboration with local authorities to implement effective water conservation strategies. Ultimately, the objective is to foster a sense of responsibility among citizens towards natural resource preservation and ensure long-term water sustainability for future generations.

This project aims to promote widespread awareness and practical understanding of **rainwater harvesting (RWH)** as a vital solution to the growing challenge of water scarcity in both urban and rural areas. Rapid urbanization, industrial growth, and population increase have put immense pressure on existing water resources, leading to severe depletion of groundwater levels and seasonal shortages. To address this issue, the project emphasizes the need to **educate citizens, students, farmers, and policymakers** about the principles, benefits, and methods of rainwater harvesting.

Through awareness campaigns, community workshops, street plays, and school programs, people are encouraged to adopt simple and cost-effective rainwater collection techniques. In **urban regions**, the focus is on rooftop harvesting systems, percolation pits, and recharge wells that help reduce waterlogging and enhance groundwater levels. In **rural areas**, traditional and community-based methods such as farm ponds, check dams, contour bunding, and percolation tanks are promoted to support irrigation and livestock needs.

ACTIVITY-01

CREATING AN AWARENESS REGARDING RAIN WATER HARVESTING IN URBAN AND RURAL AREA

1.1 INTRODUCTION

The Omicron variant of the COVID-19 virus has emerged as a major threat to public health globally, and it is essential to create awareness about the virus and its prevention, especially in rural areas. Water is one of the most essential natural resources for life, yet its availability is rapidly declining due to overuse, pollution, and uneven rainfall distribution. In many parts of the world, including India, water scarcity has become a serious issue affecting both urban and rural communities. Rainwater harvesting is an effective and sustainable method to conserve water and recharge groundwater levels. It involves collecting and storing rainwater for various uses, thereby reducing dependence on external water sources.

This project aims to create awareness among people about the importance and techniques of rainwater harvesting. By educating citizens, students, and local communities, the initiative seeks to promote the adoption of simple and efficient rainwater collection systems. In urban areas, rooftop harvesting and recharge pits can help reduce water shortages, while in rural areas, traditional ponds and check dams can support agriculture and livestock. Spreading awareness and encouraging active participation will help build a sustainable future and ensure the availability of clean water for generations to come.

Water is the foundation of life and development, yet the world today faces an alarming decline in water availability due to factors like population growth, urbanization, deforestation, and changing climate patterns. Many cities and villages are already experiencing acute water shortages, especially during dry seasons. To overcome this challenge, it is essential to adopt sustainable water management practices, and rainwater harvesting stands out as one of the most effective and eco-friendly solutions.

1.2 DESCRIPTION

The project “Creating an Awareness Regarding Rain Water Harvesting in Urban and Rural Areas” is designed to educate and motivate people to adopt sustainable methods of conserving water. The main objective of this initiative is to spread knowledge about how rainwater, a freely available natural resource, can be effectively collected, stored, and used for various purposes such as domestic consumption, irrigation, and groundwater recharge. In urban areas, the project focuses on teaching residents about rooftop rainwater harvesting systems, storage tanks, recharge wells, and percolation pits that can be implemented in houses, schools, offices, and apartment complexes. These methods help reduce water bills, prevent urban flooding, and replenish depleting groundwater levels.

In rural areas, awareness is created about traditional and community-based techniques like farm ponds, contour bunding, check dams, and percolation tanks. These methods are cost-effective and help farmers manage irrigation needs, especially during dry seasons. Demonstrations, training sessions, and awareness drives are organized to educate villagers about how such methods can improve crop yield and ensure year-round water availability. The project also includes seminars, rallies, workshops, posters, and digital campaigns to reach a wider audience. Schools and colleges are involved to inspire the younger generation to take part in environmental conservation activities. By encouraging collaboration between local communities, government bodies, and non-governmental organizations (NGOs), the project promotes collective responsibility towards sustainable water management.

Ultimately, this initiative aims to bring about a positive change in people’s attitude and behavior towards water conservation. It strives to make rainwater harvesting a common practice in every household and community, ensuring long-term water security, reducing water scarcity, and contributing to the overall environmental balance.

Figure 1.2: Rural Area: Save rain, save life—harvest water today to nurture tomorrow's village.

RELATED PHOTOS

Figure 1.3: This picture shows a serene lake that highlights the importance of conserving and storing rainwater to recharge groundwater and prevent water scarcity.

Figure 1.4: This lush green field illustrates how harvested rainwater supports agriculture in rural areas by providing sustainable irrigation and improving crop yield.

CONCLUSION

The project on creating awareness regarding rainwater harvesting emphasizes the urgent need for sustainable water conservation practices in both urban and rural areas. With increasing population, climate change, and overexploitation of groundwater, the importance of rainwater harvesting cannot be overlooked. By educating people and demonstrating simple yet effective harvesting techniques, this initiative helps individuals understand their role in preserving natural resources.

The project successfully highlights that rainwater harvesting is not just a technical solution but a social responsibility that every citizen must adopt. Urban communities can implement rooftop collection and recharge systems to reduce water scarcity, while rural communities can utilize traditional methods to support agriculture and daily needs. Awareness campaigns, workshops, and community participation have played a key role in spreading knowledge and inspiring action.

Overall, this initiative fosters a sense of responsibility towards the environment and promotes the sustainable use of water. By working together and adopting rainwater harvesting practices, we can ensure a reliable water supply, restore groundwater levels, and secure a cleaner and greener future for generations to come.

ACTIVITY-02
FACILITATING 100% DIGITIZED MONEY
TRANSACTION

ABSTRACT

Mobile payment apps are also known as digital payment apps which are used for easy transactions and payments. These payment apps were introduced to customers for their benefits. There are various payment apps which are used for UPI payments like Google pay Phone pe, Paytm etc. Now days the online payment apps users are increased dramatically and also the payment options have been spread in local market. The customers are highly beneficial and satisfied towards payment apps. This study is focused on the usage of payment apps by customers and also their satisfaction towards payment apps. Cashless transactions like transactions through e-wallets, have various benefits like reduction in black money, reduction in crime rates, helps in improving economic growth of the country, helps in fighting against terrorism, attract more foreign investors.

ACTIVITY – 02

FACILITATING 100% DIGITIZED MONEY TRANSACTION

2.1 INTRODUCTION

The “Digital India” is the Indian Government’s flagship program with a vision to convert India into a digitally empowered country. “Faceless, Paperless, Cashless” is one of Supposed function of Digital India. Digital payment system has gained importance nowadays, especially after demonetization. The government is taking essential steps to encourage the public to use payment gateway platforms. To promote payment gateways, it has declared discounts on purchases of certain products digitally. It has also introduced UPI (United Payment Interface) which is app based to transact across multiple banks.

Another improved version is set to be unveiled by the government, which makes banking transactions through mobile phones without internet by a platform called USSD (Unstructured Supplementary Service Data).

These initiatives have provided extensive boost up to the digital payment system in the country. Government’s other initiatives like BHIM and UPI are supporting in transition and faster adoption of digital payments. Electronics Consumer transaction made at point of sale (POS) for services and products either through internet banking or mobile banking using smart phone or card payment are called as digital payment.

In today’s digital era the usage of internet has increased dramatically. Now days the customers are adopting the digital devices in order to spend less time on banking. This digital payment is very useful to transaction funds without taking any risk and also easy to handle and make use of it.

We all witnessed how technologies have been growing in modern world. On This case the online payment apps also introduced and it has been successful among customers. Major people who live in urban areas are adapted to this digital payment system. Unless very low number of people who lives in rural areas still didn’t know the importance and services of this online payment apps.

Figure 2.1: Giving information about safe online transaction using UPI ID's.

2.2 KEY BENEFITS:

1.Digital payments can help reduce fraud: Digital payments leverage several technologies to secure and encrypt transaction data and multi-factor authentication, making it more difficult for bad actors to initiate fraudulent transactions. Plus, with digital payment types like virtual credit cards, you have a one-off payment dedicated to only one vendor for only one amount, thereby helping to protect your actual credit card from being hacked.

2.Digital payments can help reduce costs and waste: The Association for Financial Professionals reports that 92% of companies accept paper checks as incoming payments, and 86% accept them as outgoing payments. Sending and receiving checks can incur hefty processing costs like bank fees, printing, postage and secure disposal. AFP found that digital payment fees are much lower—they can be less than \$0.50 per transaction—and are a greener solution. Some digital payments have no associated costs, meaning no additional fees, which could earn you cash back.

3.Digital payments can increase transaction speeds: While traditional payment methods like paper checks can take days or weeks to process and complete, digital payments can be almost instantaneous. By digitizing payments, companies can be better about paying invoices on time, every time.

4.Digital payments give you real-time cash flow visibility: When a payment occurs, the account balance reflects the change immediately and all currency conversions happen right at the moment of the transaction. Thus, executives can track expenses and income in real time and make quicker business decisions in key areas such as spending, investing and hiring.

2.3 LIST OF POPULAR ONLINE PAYMENT APPS

1.GOOGLE PAY

Google pay is a digital wallet platform and online payment system developed by google to power in-app, online, and in-person contactless purchases on mobile devices, enabling users to make payments with android phones, tablets etc.

2.PHONE PE

Phone pe is an Indian digital wallet platform and online payment company. Using Phonepe, users can send and receive money, recharge mobile, DTH, data cards, make utility payments, pay at shops, invest in tax saving funds, liquid funds, buy insurance and mutual funds for gold. Paytm is (a partial abbreviation for ‘Pay through mobile’) Is an Indian multinational e-commerce payment system and financial technology company based in Noida, Uttar Pradesh, India. Paytm is currently available in 11 Indian languages and offers use cases like mobile recharges, utility bill payments, travel, movies, and as well as in store payment at grocery stores and educational institutions with the Paytm QR code.

3.KOTAK 811

Kotak 811 is a zero-balance digital bank account available to everyone (Resident Indian individuals only). Kotak 811 lets you choose between zero balance account or an 811- edge savings account based on your needs, which acts as a one stop solution for all your financial needs and day to – day transactions.

4.BHIM APP

Bhim (Bharat interface for money) is an Indian mobile payment app developed by the national payments corporation of India (NPCI), based on the unified payments interface (UPI). Named after B.R. Ambedkar and launched on 30 December 2016, it is intended to facilitate e-payments directly through banks and drive towards cashless transactions.

2.4 ADVANTAGES OF DIGITAL PAYMENT

1. Easy and convenient:

Digital payments are easy and convenient. You do not need to take loads of cash with you. All you need is your mobile phone or Aadhaar number or a card to pay. UPI apps and E- Wallets made digital payments easier.

2. Pay or send money from anywhere:

With digital payment modes, you can pay from anywhere anytime. Suppose your close friend's mother fell ill at night. He called you at midnight and asked some money. Don't worry, you can send money to your friend using digital payment modes such as UPI apps, USSD or E-Wallets.

3. Written record:

You often forget to note down your cash spendings. Or even if you note, it takes a lot of time. But you do not need to note your spendings every time with digital payments. These are automatically recorded in your passbook or inside your E-Wallet app. This helps to maintain your record, track your spendings and budget planning.

4. Less Risk:

Digital payments have less risk if you use them wisely. If you lose your mobile phone or debit/credit card or Aadhar card you don't have to worry a lot. No one can use your money without MPIN, PIN or your fingerprint in the case of Aadhar. But it is advised that you should get your card blocked if you lost it. Also call the helpline of your E-wallet to suspend the wallet account to prevent anyone from using your wallet money.

Figure 2.2: Group photo after the completion of the day.

CONCLUSION

In conclusion, the digital payments ecosystem in India has grown significantly in recent years, driven by government initiatives, an increase in internet and smartphone penetration, and the rise of e-commerce. The digital payment ecosystem is supported by private players who offer a range of digital payment services. The future of digital payments in India looks bright with the expected growth in the number of internet users and e-commerce market size.

ACTIVITY -03

DEVELOPING AND MANAGING

EFFICIENT GARBAGE DISPOSAL

SYSTEM

ABSTRACT

The current practices related to the various waste management initiatives taken in India for human well-being. The other purpose is to provide some suggestions and recommendations to improve the waste management practices in Indian towns. It offers deep knowledge about the various waste management initiatives in India and find out the scope for improvement in the management of waste for the welfare of the society. Nowadays waste has become a vital part of our economy, as a by-product of economic activity. It originates from businesses, the government and households and following appropriate management techniques, it can be used as an input to economic activity for instance through material or energy recovery. Waste is produced by all activities and although it is a locally arising problem it has both local and global effects. Societies need to dispose their waste products creating a source of environmental pollution. Sustainable waste management requires the combination of skills and knowledge of physical sciences and engineering together with economics, ecology, human behavior, entrepreneurship and good governance. This paper discusses extensively the policy framework and the legislative background around waste and its management in the EU and worldwide. In this way, it focuses on the treatment options for waste under the Circular Economy approach having in mind the idea of closing the loop and hence achieving a more efficient use of resources.

ACTIVITY-03

DEVELOPING AND MANAGING EFFICIENT GARBAGE DISPOSAL SYSTEM.

3.1 INTRODUCTION

“There are few things certain in life – one is death, second is change and the other is waste.” No one can stop these things to take place in our lives. But with better management we can prepare ourselves. Here we will talk about waste and waste management. Each of us has a right to clean air, water and food. This right can be fulfilled by maintaining a clear and healthy environment. Now for the first question, what is waste? Any material which is not needed by the owner, producer or processor is waste. Generally, waste is defined as at the end of the product life cycle and is disposed of in landfills. Most businesses define waste as “anything that does not create value” (BSR, 2010). In a common man’s eye anything that is unwanted or not useful is garbage or waste. However scientifically speaking there is no waste as such in the world. Almost all the components of solid waste have some potential if it is converted or treated in a scientific manner.

In India, the urban local bodies, popularly known as the municipal corporations/councils, are responsible for management of activities related to public health. However, with increasing public and political awareness as well as new possibilities opened by economic growth, solid waste management is starting to receive due attention. The various initiatives taken by government, NGOs, private companies, and local public drastically increased in the past few decades. Nonetheless, land filling is still the dominant solid waste management option for the United States as well as many other countries like India around the world. It is well known that waste management policies, as they exist now, are not sustainable in the long term. Thus, waste management is undergoing drastic change to offer more options that are more sustainable. We look at these options in the hope of offering the waste management industry a more economically viable and socially acceptable solution to our current waste management dilemma. This paper outlines various advances in the area of waste management.

Figure 3.1: Created awareness about proper waste management

3.2 CLASSIFICATION OF WASTE

There may be different types of waste such as Domestic waste, Factory waste, Waste from oil factory, E-waste, Construction waste, Agricultural waste, Food processing waste, Biomedical waste, nuclear waste, Slaughter house waste etc.

- We can classify waste as follows:
- Solid waste- vegetable waste, kitchen waste, household waste etc.
- E-waste- discarded electronic devices such as computer, TV, music systems etc.
- Liquid waste- water used for different industries, tanneries, distilleries, thermal power plants
- Plastic waste- plastic bags, bottles, bucket, etc.
- Metal waste- unused metal sheet, metal scraps etc.

❖ Wet waste (Biodegradable) includes the following:

- Kitchen waste including food waste of all kinds, cooked and uncooked, including eggshells and bones
- Flower and fruit waste including juice peels and house-plant waste
- Garden sweeping or yard waste consisting of green/dry leaves
- Sanitary wastes

❖ Dry waste (non-biodegradable) includes the following:

- Paper and plastic, all kinds
- Cardboard and cartons
- Containers of all kinds excluding those containing hazardous material
- Packaging of all kinds
- Glass of all kinds
- Metals of all kinds
- Rags, rubber
- House sweeping (dust etc.)
- Ashes
- Foils, wrappings, pouches, sachets and tetra packs (rinsed)
- Discarded electronic items from offices, colonies viz. cassettes, computer diskettes, printer cartridges and electronic parts.
- Discarded clothing, furniture and equipment.

Figure 3.2: Explanation about classification of dry and wet waste management

Figure 3.3: Identification of improper garbage disposal areas

3.3 DISPOSAL VS. MANAGEMENT

There are common practices to dispose waste from ordinary people. But disposal of waste is becoming a serious and vexing problem for any human habitation all over the world. Disposing solid waste out of sight does not solve the problem but indirectly increases the same manifold and at a certain point it goes beyond the control of everybody. The consequences of this practice such as health hazards, pollution of soil, water, air & food, unpleasant surroundings, loss of precious resources that could be obtained from the solid waste, etc. are well known. That's why it is essential to focus on proper management of waste all over the world. Waste management has become a subject of concern globally and nationally. The More advanced the human settlements, the more complex the waste management.

There is a continuous search for sound solutions for this problem but it is increasingly realized that solutions based on technological advances without human intervention cannot sustain for long and it in turn results in complicating the matters further. Management of solid waste which generally involves proper segregation and scientific recycling of all the components is in fact the ideal way of dealing with solid waste. Solid waste management (SWM) is a commonly used name and defined as the application of techniques to ensure an orderly execution of the various functions of collection, transport, processing, treatment and disposal of solid waste (Robinson, 1986).

CONCLUSION

In view of existing social and living conditions, economic interest we have tried to create consciousness among people. Being able to do something for the society we live in is a great opportunity in itself for giving back to the society, which was made compulsory by All India Council for Technical Studies (AICTE) for technical education and to promote development in the country in a coordinated and integrated manner by the upcoming generation. This initiative by AICTE to make every student take part in some social cause along with the academics is really commendable. As part of this initiative, we the students of JIT spread awareness among the villagers about Digital India Mission, Effects of tobacco consumption, Environmental issues, awareness regarding the usage of plastic and development and management of garbage disposal system. Villagers were given proper guidance about the evolving technologies. Their queries were also discussed during the program. It was a fruitful interaction which was blissful in terms of exchange of knowledge, ideologies between the engineering graduates and the villagers.

ACTIVITY -04

DEVELOPING SUSTIANABLE WATER MANAGEMENT SYSTEM

ABSTRACT

Water management is a crucial aspect of sustainable development, particularly in rural areas where water scarcity is a major challenge. This paper explores the development of sustainable water management systems in villages, with a focus on their effectiveness in addressing the water needs of the local community while ensuring the long-term sustainability of water resources. The study found that developing sustainable water management systems in villages requires a comprehensive approach that takes into account the local social, economic, and environmental conditions. This includes promoting water conservation and demand management, implementing efficient water supply systems, and enhancing water quality monitoring and management. The study also highlighted the importance of community participation in the development and implementation of sustainable water management systems. Local communities should be involved in the planning and decision-making process to ensure that their water needs and preferences are considered. Moreover, the study recommends the establishment of local water management committees to facilitate community participation and ownership.

ACTIVITY-04

DEVELOPING SUSTIANABLE WATER MANAGEMENT SYSTEM

4.1 INTRODUCTION

Water is a critical resource for human survival, and access to clean and safe water is a fundamental human right. However, many rural areas around the world face significant challenges in accessing and managing water resources, leading to water scarcity, poor sanitation, and other water-related problems. In this context, developing sustainable water management systems in villages is essential for improving water availability and quality and promoting the overall well-being of rural communities.

Sustainable water management systems are those that ensure the equitable and efficient use of water resources while protecting the environment and promoting social and economic development. Such systems involve the implementation of various water management techniques, including rainwater harvesting, groundwater recharge, watershed management, and water conservation measures.

In this activity, we will focus on the development of sustainable water management systems in villages, with a particular emphasis on the activities and approaches that have proven effective in addressing water-related challenges in rural areas.

The activity is organized as follows. First, we will provide a brief overview of the water- related challenges facing rural communities. Second, we will discuss the key components of sustainable water management systems and the activities that are typically implemented in villages to achieve these goals. Third, we will examine the challenges and barriers that hinder the implementation of these systems and suggest possible solutions. Finally, we will conclude by highlighting the importance of sustainable water management systems in villages and the need for collaborative efforts to achieve them.

Figure 4.1: Sustainable Water Development

Developing a sustainable water management system in villages requires a comprehensive approach that involves multiple stakeholders and considers various factors such as water availability, quality, and demand. Here are some steps that can be taken to develop such a system

- **Conduct a water audit:** The first step is to understand the existing water resources in the village and how they are being used. This can be achieved through a water audit, which involves measuring water sources, consumption patterns, and losses.
- **Identify water management techniques:** Based on the water audit, identify the most appropriate water management techniques for the village. This could include rainwater harvesting, groundwater recharge, watershed management, and water conservation measures.
- **Engage the community:** Community participation is essential for the success of any water management system. The community should be involved in the planning, implementation, and monitoring of the system. This will help ensure that the system is tailored to the needs of the community and that it is sustainable in the long run.
- **Build capacity:** Building the capacity of the community and local institutions is crucial for the success of the water management system. This could involve providing technical training, financial support, and capacity-building programs.
- **Ensure sustainability:** A sustainable water management system should be designed to ensure long-term sustainability. This includes regular monitoring, maintenance, and upgrading of the system, as well as planning for future water needs.

Figure 4.2: Integrated Water Resources Management in Rural Areas

Figure 4.3: Taking About the Proper Management of Water Resources

CONCLUSION

Developing a sustainable water management system in villages is crucial for ensuring access to safe and sufficient water for the local community. The implementation of various water management techniques such as rainwater harvesting, groundwater recharge, and watershed management have proved to be effective in improving water availability and reducing water-related problems in many villages. However, the success of these techniques depends on factors such as technical expertise, financial resources, and community participation.

To develop a sustainable water management system in villages, it is essential to involve local communities in the planning and implementation of water management activities. This ensures that the solutions are appropriate to the local context and are implemented with the active participation of the community. Additionally, providing technical assistance and financial support to villages that lack the resources to implement these activities is crucial.

The establishment of a network of village-level water management committees can facilitate information-sharing and cooperation among villages, which is essential for the long-term sustainability of the water management system.

ACTIVITY-05
TO SKILL RURAL POPULATION

ABSTRACT

Rural populations often face unique challenges in accessing education and skill-building opportunities. In this activity, we explore strategies for effectively skilling rural populations. Drawing on research and best practices from around the world, we identify key factors that contribute to successful skill-building initiatives in rural areas, including community engagement, technology-enabled learning, and partnerships with local organizations. We also examine the potential of emerging technologies such as mobile learning and virtual reality to improve access to education and training in remote areas. This activity highlights the importance of considering the specific needs and circumstances of rural communities when designing and implementing skill-building programs, and provides recommendations for policymakers, educators, and other stakeholders involved in rural development initiatives. Ultimately, our goal is to promote inclusive and equitable skill-building opportunities that can help rural populations thrive in a rapidly changing global economy.

ACTIVITY-05

TO SKILL RURAL POPULATION

5.1 INTRODUCTION

To skill rural population refers to the process of providing training and education to people living in rural areas to enhance their skills and knowledge in various fields, including agriculture, healthcare, technology, and entrepreneurship. The goal is to equip rural populations with the necessary skills to improve their quality of life, increase their income, and contribute to the development of their communities.

Rural areas often lack access to the same educational and training opportunities as urban areas, which can limit the ability of rural populations to improve their skills and knowledge. This can result in limited economic opportunities, lower incomes, and a lower standard of living compared to urban areas.

To address this issue, governments, non-profit organizations, and private companies are working to provide training and education programs tailored to the needs of rural populations. These programs can include vocational training, apprenticeships, entrepreneurship programs, and digital literacy training.

One example of a program aimed at skilling rural populations is the Indian government's Pradhan Mantri Kaushal Vikas Yojana (PMKVY), which provides vocational training to youth and unemployed individuals in various sectors, including agriculture, healthcare, and construction. The program aims to train 10 million people by 2020 and has already trained over 8 million people across the country.

Skilling rural populations can have a significant impact on their livelihoods and the development of their communities. By providing access to education and training, rural populations can increase their income and economic opportunities, improve their quality of life, and contribute to the development of their local economies. It also helps to bridge the urban-rural divide by providing equal access to opportunities for all citizens, regardless of their location.

In addition to government initiatives, non-profit organizations and private companies are also working to skill rural populations. For example, the Rural Development Foundation in India works to provide vocational training to rural youth and women, with a focus on

sectors such as hospitality, healthcare, and retail. The foundation has trained over 15,000 individuals and helped them find employment opportunities.

Private companies are also getting involved in skilling rural populations, particularly in sectors such as agriculture and manufacturing. For example, companies such as Mahindra & Mahindra and Tata Motors in India are providing training to rural youth in automotive repair and maintenance, which not only helps to create skilled employment opportunities but also supports the development of the automotive industry in rural areas.

The benefits of skilling rural populations extend beyond the individuals themselves. As rural populations become more skilled and educated, they can contribute to the development of their communities, creating a ripple effect of positive impact. This can lead to increased economic growth, improved healthcare outcomes, and better living standards for all citizens in the area.

5.2 DESCRIPTION

The lack of access to educational and training opportunities in rural areas can limit the ability of rural populations to improve their skills and knowledge, which can result in limited economic opportunities, lower incomes, and a lower standard of living compared to urban areas. To address this issue, governments, non-profit organizations, and private companies are working to provide training and education programs tailored to the needs of rural populations.

This involves providing training and education to people living in rural areas to enhance their skills and knowledge in various fields, including agriculture, healthcare, technology, and entrepreneurship. The goal is to equip rural populations with the necessary skills to improve their quality of life, increase their income, and contribute to the development of their communities.

Skilling rural populations can have a significant impact on their livelihoods and the development of their communities. By providing access to education and training, rural populations can increase their income and economic opportunities, improve their quality of life, and contribute to the development of their local economies. It also helps to bridge the urban-rural divide by providing equal access to opportunities for all citizens, regardless of their location.

Non-profit organizations and private companies are also getting involved in skilling rural

populations, particularly in sectors such as agriculture and manufacturing. For example, some companies are providing training to rural youth in automotive repair and maintenance, which not only helps to create skilled employment opportunities but also supports the development of the automotive industry in rural areas.

Governments are also taking measures to promote skilling in rural populations. In India, the government's Pradhan Mantri Kaushal Vikas Yojana (PMKVY) provides vocational training to youth and unemployed individuals in various sectors, including agriculture, healthcare, and construction. The program aims to train 10 million people by 2020 and has already trained over 8 million people across the country. The benefits of skilling rural populations extend beyond the individuals themselves. As rural populations become more skilled and educated, they can contribute to the development of their communities, creating a ripple effect of positive impact. This can lead to increased economic growth, improved healthcare outcomes, and better living standards for all citizens in the area.

5.3 CURRENT SITUATION

The current situation of rural populations is characterized by limited access to education and training opportunities, low levels of technological adoption, and a lack of entrepreneurship skills. This results in high levels of poverty, limited economic opportunities, and low levels of development in rural communities.

5.4 CHALLENGES

The challenges faced by rural populations include limited access to quality education and training opportunities, lack of infrastructure and resources, limited access to financial services, and limited access to markets. These challenges hinder their ability to generate income, start and grow businesses, and contribute to the development of their communities. Skilling rural people is crucial for the overall development of a country. Rural communities face several challenges that limit their access to education, employment, and other opportunities. To skill rural people, the following strategies and interventions can be implemented:

1. Promoting Education: Education is critical to enhancing employability and income-generating abilities. This includes promoting access to primary, secondary, and tertiary education, as well as vocational and technical training. Educational institutions must be established and equipped with necessary resources, including internet connectivity and technology infrastructure, to support quality learning outcomes.

2. Vocational Training: Vocational training programs offer practical training to enhance employability and income-generating abilities. These programs must be tailored to the specific needs of rural communities and focus on developing skills that are in demand in these areas. This includes training in areas such as agriculture, healthcare, and hospitality, among others.

3. Entrepreneurship Programs: Entrepreneurship programs are crucial to promoting self-employment and income generation in rural communities. These programs should focus on developing skills in business management, financial literacy, and marketing. Access to financial services and credit facilities must also be provided to enable entrepreneurs to start and grow their businesses.

4. Infrastructure and Resources: Effective skilling programs require collaboration between government agencies, non-profit organizations, and private sector entities to provide resources and infrastructure to support skills development in rural areas. This includes establishing educational institutions, vocational training centers, and entrepreneurship development centers, as well as providing access to technology infrastructure and internet connectivity.

5. Partnerships: Partnerships with local communities, non-governmental organizations, and private sector entities can provide additional resources.

CONCLUSION

Skilling rural people is critical to addressing the unique challenges faced by individuals living in rural areas. By promoting education, vocational training, and entrepreneurship, and providing the necessary infrastructure and resources, rural communities can enhance their employability and income-generating abilities, which can contribute to economic development and prosperity. The implementation of effective strategies and interventions is necessary to ensure the sustainability and success of skilling programs in rural areas.

SUMMARY OF ACTIVITIES AND HOURS SPENT

SL.NO	ACTIVITY CARRIED	PLACE	FROM	TO	TIME	HOURS
1.	CREATING AN AWARENESS REGARDING RAIN WATER HARVESTING URBAN AND RURAL AREA	AVARAGERE	05/05/24	15/05/24	09:00 AM to 05:00 PM	40
2.	FACILITATING 100% DIGITIZED MONEY TRANSACTION	THOLAHUNASE	01/09/24	11/09/24	09:00 AM to 05:00 PM	40
3.	DEVELOPING AND MANAGING EFFICIENT GARBAGE DISPOSAL SYSTEM	AVARAGERE	10/02/25	20/02/25	09:00 AM to 05:00 PM	40
4.	DEVELOPING SUSTIANABLE WATER MANAGEMENT SYSTEM	ANJANEYA MILL	12/07/25	22/07/25	09:00 AM to 05:00 PM	40
5.	TO SKILL RURAL POPULATION	AVARAGERE	25/07/25	02/08/25	09:00 AM to 05:00 PM	40
Total hours spent:						200

PEOs

Program Education Objectives

PEO 1	Professional Excellence: Graduates of the program will be able to demonstrate professional excellence to address real-world challenges in the field of technology.
PEO 2	Innovation and Entrepreneurship: Graduates of the program will be able to exhibit a strong inclination towards innovation and entrepreneurship.
PEO 3	Social Responsibility and Ethics: The graduates will be socially responsible and will demonstrate ethical leadership in their professional and personal lives.

PSOs

Program Specific Outcomes

PSO 1	Effective Information Management: Ability to design and manage databases, information repositories, and content management systems for ensuring data integrity, accessibility, and usability.
PSO 2	Software Development and Entrepreneurship for Successful Career: Analyze, design and develop data-driven software systems and applications that harness the power of emerging computing technologies for successful career.

Vision and Mission of the Institution

Vision of the Institute:

Technical manpower development to build professionally excellent, globally competitive, socially responsible engineers and entrepreneurs with human values.

Mission of the Institute:

M1	To provide quality education through innovation in teaching to create technologically competent engineers.
M2	To achieve excellence in research and development to advance science and technology to the ever changing needs of society.
M3	To create outstanding professionals capable of working in multi-cultural environment.
M4	To produce quality engineers with high ethical standards and professionalism.

Vision & Mission of the Program

Vision of the Department:

To develop professionally excellent, socially responsible Information Science Engineers and Entrepreneurs through Teaching, Research & Development and Cognitive skills with human eminence.

Mission of the Department:

M1	To promote the development of skilled professionals through strong foundations and experiential learning.
M2	To foster research and entrepreneurship by innovative solutions and research-driven education.
M3	To support social responsibility, ethical conduct, nurturing a culture of integrity, and empathy by fostering a compassionate global community.
